(54) SPEAKER

(57)Abstract:

PROBLEM TO BE SOLVED: To provide a speaker with which sounds can be reproduced much closer to original sounds by reducing noises generated from a speaker cabinet and improving the sound quality of the speaker while suppressing the transmission of vibrations between the speaker cabinet and a speaker unit.

SOLUTION: A yoke 11a of a speaker unit 1a is directly supported by a supporting rod 3a, and the supporting rod 3a is fixed on a fixed stand 4a installed on a ground surface G. Besides, a speaker unit 2a is just abutted with a frame 14a but not bonded and supported by the supporting rod 3a while being separated from the ground surface G. As a result, the unwanted vibrations of a magnetic circuit composed of the yoke 11a, magnet 12a and plate 13 are suppressed, absorbed through the supporting rod 3a and the fixed stand 4 to the ground surface G and suppressed from being directly transmitted to the speaker cabinet 2a.
